Ithaca, N.Y.

Dear Max-

Enclosed is a fresh isolate of H-206. It is a pool of two colonies on EMS Lac which concurrently gave Lacy on EMS Lac. It has not been rechecked, especially on maltose; I will do so promptly. However, it should be immediately useful, although it will have segregated to a large extent on this medium (nutrient agar) by the time you get it.

I hope I can remember to bring along a couple of slides showing the nuclear cytology of H-168. It is complex enough to admit readily of the many-nucleus interpretation of the pedigrees.

See you in NY.

Till then,

Joshua Lederberg
